

EURO LIVE

Final Master Application Plan

Simple English Version for Developer

Document	Final Master Requirements
Project	Euro Live
Version	1.0
Date	18 September 2026

Core principle: safety, fairness, clear records, and simple control.

The items marked as Core Requirements should be treated as the base product scope, not as separate optional add-ons. Media & entertainment items are listed separately as future enhancements.

1. Project Goal

- Build Euro Live as a secure live-streaming platform with clear control for the company, fair protection for hosts and users, and transparent salary and agency payments.
- Reduce manual work by automating salary calculation, agency share, reporting, audit history, and security alerts.
- Keep important powers with the Master Admin while giving each role only the permissions it really needs.

2. User Roles and Permission Levels

2.1 Master Admin

- Highest control level in the application.
- Can review, approve, correct, hold, release, freeze, suspend, or restore actions according to company policy.
- Only the Master Admin can make final changes to host salary records, agency penalties, protected official accounts, and high-risk fraud cases.
- Can view complete audit history. Audit history must not be editable or deletable by normal admins, resellers, agencies, or hosts.
- Can disable the power of another admin, reseller, official, or agency when required.

2.2 Official / Reseller

- Official or reseller accounts should show a clear Official/Reseller label and ID number.
- Normal users should not be able to kick or blacklist a protected official/reseller account.
- For emergency host alerts, the assigned authorized reseller/official can receive an urgent notification and quickly check the room or ID.
- A reseller/official must not receive private complaint evidence unless the company gives that specific permission.

2.3 Host

- A host can kick or blacklist a bad user from her own room.
- A host can access only her own salary information and personal dashboard.
- A host can submit private complaints with evidence directly to the Master Portal.
- A host can change her own room background image.
- A host cannot edit her own salary amount, agency share, or company financial records.

2.4 Room Admin

- A room admin can mute bad messages or comments according to host rules.
- A room admin cannot kick or blacklist users unless the company later gives a separate permission.
- All moderation actions must be logged.

2.5 Normal User

- A user can report another user, host, agency, reseller, or room issue through the Report Center.
- A user cannot access host salary data or private complaint files.
- A user cannot use host-only background controls.

3. Automatic Host Salary and Agency Share System - Core Requirement

3.1 Personal Host Salary Wallet

- Every host has a private Salary Wallet / Salary Account inside Euro Live.
- The salary page should show: working hours, target achieved, salary earned, bonus, deductions (if any), payment status, hold status, and previous payment history.
- The page should also show confirmed ban/violation history for the salary period, but a ban alone must not automatically cut salary or bonus.

- Only confirmed violations after review can affect a bonus or penalty. The company can set a configurable rule, for example a bonus deduction after 3 confirmed violations in one salary period.
- If a deduction is applied, the host should see the reason and the approved proof or case reference.

3.2 One-Click Salary & Agency Auto-Pay

- The system automatically calculates each host salary from the approved target rules.
- The system automatically calculates the related agency share at the same time.
- The Master Admin sees one complete payout list before any money is released.
- The Master Admin can use one action to create the full payout batch instead of paying each host and agency one by one.
- Host salary goes to the host salary wallet/account. Agency share goes to the correct agency wallet/account.

3.3 Three-Day Salary Hold and Final Approval

1. System calculates the salary and agency share.
2. Master Admin reviews the payout list and approves the batch for hold.
3. The approved amount stays in a 3-day secure hold period.
4. During the hold period, only the Master Admin can cancel, correct, or change an amount. Every change must record date, time, old amount, new amount, reason, and admin ID.
5. After the 3-day hold, the Master Admin gives Final Release approval.
6. The system releases all approved host salaries and agency shares automatically.
7. This process helps prevent wrong payments and gives time to correct genuine mistakes.

3.4 Salary Privacy Lock

- The host salary section should support Face Verification, Fingerprint, or a secret PIN/code.
- The host can choose the available method supported by her phone.
- Use the phone operating system biometric security. Do not store raw fingerprint or face biometric data on the Euro Live server.
- If biometric verification fails, a secure PIN and/or OTP recovery method should be available.
- Agency owners, resellers, room admins, and normal users cannot open or edit a host salary page.
- Master Admin keeps the authorized company-side control for salary corrections and final approval.

4. Multi-Country Salary and Currency System - Core Requirement

- Euro Live should support country-based salary and agency rules from the start.
- Initial countries: Pakistan, India, and Bangladesh. The Master Admin should be able to add more countries later.
- Each country can have its own target table, salary table, agency share rules, currency, and payout settings.
- The Master Admin sets the approved conversion/settlement rate for the salary cycle. Salary should not change every day because of automatic currency movement unless the company chooses that option.
- Reports should show both the system value and the local currency value clearly.

5. Complaint, Evidence and Host Protection System - Core Requirement

5.1 Private Report Center

- Every host and user should have a clear Report / Complaint section in their profile or panel.
- They can write the complaint and attach screenshots, audio, video, or other allowed evidence.
- The complaint and evidence go directly to the authorized Master Portal team.
- Private evidence must be protected and not automatically shared with an agency owner, reseller, other host, or normal user.
- Each complaint should receive a case number, status, date/time, and action history.
- The complainant should be able to see simple status updates such as Received, Under Review, Action Taken, or Closed.

5.2 Fair Review Before Punishment

- No salary cut, bonus cut, agency fine, permanent ban, or serious penalty should happen only because someone made an accusation.
- The authorized team should first review the available evidence and activity logs.
- If a violation is confirmed, the system should save the proof, rule violated, decision, date/time, and responsible admin.
- Where appropriate, the affected host/user/agency should receive the reason and case reference.
- This protects both the complainant and the person being accused.

5.3 Agency Owner Misconduct

- If an agency owner is accused of harassment, blackmail, financial misuse, or other serious misconduct, the case goes to the Master Portal.
- After evidence review, authorized Master Admin options can include warning, fine, temporary suspension, agency freeze, removal of powers, or agency ban according to company policy.
- All actions must be recorded in the audit history.

5.4 Host Protection Lock

- When a host submits a serious complaint or emergency report, sensitive changes to her salary, target, account status, or agency assignment can be temporarily locked.
- An agency owner, reseller, or normal admin should not be able to punish the host by changing financial records during an active protection review.
- Any attempt to make a blocked change should generate an alert and be recorded for the Master Admin.
- The Master Admin can unlock or approve necessary changes after review.

6. Emergency SOS Safety Chain - Core Requirement

- A host should have an Emergency / SOS button for urgent harassment, blackmail, threat, or serious safety situations.
- When pressed, the system sends a high-priority alert to the Master Portal immediately.
- The assigned authorized reseller/official can also receive an urgent alert with the host ID/room ID so they can check quickly.
- If the first responsible person does not respond within the company-set time, the alert automatically escalates to the next authorized official or Master team.
- The host should see that the emergency report was received and is being handled.
- Emergency alerts, response time, actions, and outcome must be saved in the case history.

7. User Safety and Room Moderation - Core Requirement

- Host: can kick and blacklist bad users from her own room.
- Room Admin: can mute bad messages/comments but cannot kick or blacklist users.
- Master Admin: can review serious reports and apply wider account actions when required.
- Every kick, blacklist, mute, unmute, ban, unban, and moderation change should create an audit log.
- A complaint or appeal option should be available for serious moderation disputes.

8. Account Security and Privacy - Core Requirement

- OTP / two-step verification for important logins and sensitive settings.
- New device login alert.
- List of logged-in devices with a Log Out All Devices option.
- Emergency Account Freeze option for suspicious access.
- Account recovery process with secure identity verification.
- Private phone numbers and personal details should not be exposed to other users unless the company intentionally allows a specific field.
- Private chats and complaint evidence should use secure access controls.

- Important permission changes should require Master Admin confirmation and be logged.

9. Game and Coin Anti-Fraud Security - Core Requirement

- Game results and coin transactions must be validated on the server, not trusted only from the mobile app.
- Use anti-cheat and abnormal-behavior detection for fake coins, impossible balances, suspicious transfers, repeated exploit patterns, or manipulated game requests.
- If the system detects a high-risk pattern, it can temporarily freeze the suspicious ID and/or coin wallet immediately.
- A temporary freeze is not a final punishment. The system should send the case to the Master Portal for review.
- After review, the Master Admin can restore the ID, correct the balance, apply a penalty, or ban the account according to company policy.
- Keep complete transaction history so fake coins or unauthorized balance changes can be traced.

10. Audit History and Admin Accountability - Core Requirement

- Keep a permanent history of who banned/unbanned an ID, kicked/blacklisted a user, muted comments, changed salary, changed coins, approved a payout, changed an agency, or changed permissions.
- Each log should include admin/user ID, action, target ID, old value, new value, reason, date/time, and related case number when available.
- Normal admins must not be able to erase audit history.
- Master Admin can search and review the full history for disputes and investigations.

11. Backup, Recovery and Server Ownership - Core Requirement

- Create an automatic database backup every 24 hours.
- Master Admin can control the backup schedule, but turning automatic backup off should require strong verification and display a clear risk warning.
- Every backup on/off change must be recorded in the audit history.
- A Manual Backup button should be available, especially before a major update.
- A tested restore/recovery process must exist so important data can be recovered after a failure.
- Source code, server accounts, database accounts, domain, Play Store account, Apple developer account, cloud services, and other critical project accounts should be owned/controlled by the company, not only by one developer.

12. Update and Maintenance Safety - Core Requirement

- New app/server updates should first be tested in a test/staging environment.
- A major production update should be released only after authorized approval.
- Keep a rollback option so the previous stable version can be restored if an update causes a serious problem.
- Use crash monitoring and server health monitoring so technical issues are noticed quickly.
- Keep a simple service/status record for major outages and recovery actions.

13. Host Dashboard - Core Requirement

- Host sees her own target progress, working hours, current salary estimate, bonus status, hold amount, payment date, and previous payments.
- Agency owner sees only the agency information allowed by company policy, such as agency target and agency share. An agency owner must not see private host complaints or protected salary details unless specifically authorized.
- Master Admin sees the complete company dashboard.

14. Host Background Control - Core Requirement

- A host can change the background of her own live room and select/upload an allowed picture.
- This control is host-only. Normal users cannot change a host room background.
- The company can apply moderation rules for prohibited images or content.
- The feature should not create a separate charge for the host unless the company later creates premium background items.

15. Pilot Test Before Full Launch - Core Requirement

- Before full rollout, test the system with a small pilot group, for example 3-4 trusted hosts and 1-2 agencies.
- Test one complete salary cycle: target calculation, salary, agency share, 3-day hold, correction, final release, complaint flow, SOS, and audit logs.
- Fix any errors found in the pilot before enabling the system for everyone.

16. Future Media & Entertainment System

- Host can play approved audio/music inside the live room.
- Host can share a selected video with the room.
- For privacy, the default design should share only the selected media, not the host's complete phone screen.
- If full screen sharing is added later, it should have clear privacy warnings, permission controls, and an immediate Stop Sharing button.
- Media controls should be available to the host according to room permissions.

17. Developer Implementation Notes

- Core safety, salary, audit, complaint, backup, and role-permission items in this document are functional requirements of Euro Live.
- Before development, the developer should mark each requirement as Existing, To Build, or Needs Clarification.
- Do not allow a single developer account to become the only owner of source code, servers, or store accounts.
- Use server-side rules for money, coins, salary, agency share, permissions, and fraud controls.
- Security-sensitive actions should never depend only on the mobile application interface.

18. Final Acceptance Checklist

- ☐ Master Admin permissions are working correctly.
- ☐ Host, room admin, reseller/official, agency, and user permissions are separated correctly.
- ☐ Salary and agency share calculate correctly.
- ☐ 3-day hold, correction, and final release work correctly.
- ☐ Face/Fingerprint/PIN salary lock works without storing raw biometric data on Euro Live servers.
- ☐ Report Center accepts text, screenshot, audio, and video evidence safely.
- ☐ SOS alert and escalation work correctly.
- ☐ Host Protection Lock prevents retaliation through salary/account changes.
- ☐ Game/coin suspicious activity freeze and review flow work correctly.
- ☐ Audit logs cannot be edited by normal admins.
- ☐ 24-hour backup and restore are tested.
- ☐ Update rollback is tested.
- ☐ Multi-country salary/currency rules are tested.
- ☐ Pilot group completes one end-to-end test before full launch.

END OF FINAL MASTER PLAN
